

Please box your final answers. Calculators are allowed, but not required. Answers may be left as fractions and/or expressions that may contain square-root ( $\sqrt{\cdot}$ ), factorial (!), permutation ( $P_r^n$ ), and combination ( $C_r^n$ ) notation.

1. A normally distributed random variable  $x$  has mean  $\mu = 72$  and a standard deviation  $\sigma = 4$ . Find the following probabilities.

(a) (4 points)  $P(x \leq 70)$

(b) (4 points)  $P(x \geq 80)$

(c) (4 points)  $P(70 < x < 80)$

2. (8 points) Suppose IQ scores are normally distributed with mean  $\mu = 100$  and standard deviation  $\sigma = 15$ . How high must a person score in order to be in the 98<sup>th</sup> percentile (that is, in order to score higher than 98% of the population)?

3. (8 points) A grain loader can be set to discharge grain in amounts that are normally distributed, with mean  $\mu$  bushels and standard deviation  $\sigma = 25.7$  bushels. If a company wishes to use the loader to fill containers that hold 2000 bushels of grain and wants to overfill only one container in 100, at what value of  $\mu$  should the company set the loader? (*FYI: 1 bushel = 4 pecks = 8 gallons*)

4. Consider a (discrete) binomial random variable  $x$  with  $n = 15$  and  $p = .4$ .

(a) (2 points) What are the mean  $\mu$  and the standard deviation  $\sigma$  for  $x$ ?

(b) (2 points) What “rule of thumb” lets us know that the distribution of  $x$  can be approximated by a (continuous) normal distribution?

(c) (8 points) Use the normal approximation to find the following probabilities.

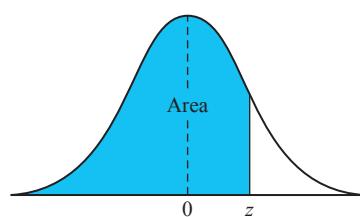

i.  $P(x < 5)$

ii.  $P(x \leq 5)$

iii.  $P(x > 5)$

iv.  $P(x \geq 5)$

5. (8 points) Data collected over a long period of time show that a particular genetic defect occurs in 1 of every 1000 children. The records of a medical clinic show  $x = 70$  children with the defect in a total of 50,000 examined. If the 50,000 children were a random sample from the population of children represented by past records, what is the probability of observing a value of  $x$  equal to 70 or more? Would you say that the observation of  $x = 70$  children with genetic defects represents a rare event?
